

Raised Cabin Forklift Improves Visibility

Description

This Belgian employer (Borealis) designed a prototype of a special forklift for longer distance transport within the plant. The worker can see over the load and drive in the forward direction instead of twisting his/her head and neck while driving the forklift in reverse. The driver's seat has vibration and shock absorbing properties. Now, the company uses 8 of these modified tall forklifts at the plant.

These models have double-load capacity, thus, improving productivity.

*European safety and health award winner for
"New, innovative design"*

*Because of this effort, the manufacturer now
offers these modified forklifts commercially.*
